

conecto STRIPJOINT & ANGLE BARS

TECHNICAL DATA SHEET

Conecto Strip Joint profile combines the strength of steel reinforcement with the practicality of timber formwork. It attaches to the top of the timber during the initial concrete pour and stays securely in place once the formwork is removed, providing reliable edge protection. Featuring steel strips, it is ideal for industrial floors and warehouse places. With a standard length of three meters, it offers a practical and efficient solution for demanding construction needs.

Angle Bars are designed to be used as protecting profile for the inner corner of the concrete constructions. They can transfer moderate loads to the concrete.

The standard length of the angle is 3 meters. They can be cut easily to required length at building site. Anchoring of the angle is based on rebar anchors.
